Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on CMP Pads competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Chemical mechanical polishing/planarization (CMP) is a process that removes materials by a combination of chemical and mechanical (or abrasive) actions to achieve highly smooth and planar material surfaces. Chemical-mechanical polishing (CMP) is often associated with chemical-mechanical planarization which is a polishing process assisted by chemical reactions to remove surface materials. CMP is a standard manufacturing process practiced at the semiconductor industry to fabricate integrated circuits and memory disks. When the purpose is to remove surface materials, it is referred to as chemical-mechanical polishing. However, when the purpose is to flatten a surface, it is referred to as chemical-mechanical planarization. CMP is considered to be a tribochemical process because of the synergy between friction and corrosion. CMP Pad (Chemical Mechanical Polishing Pad) is a product which increases semiconductor integration by smoothening the semiconductor wafer surface through physical and chemical polishing processes. The silicon carbide (SiC) chemical mechanical planarization (CMP) pads market is evolving rapidly, driven by the booming demand for SiC power devices in electric vehicles (EVs), renewable energy, and 5G infrastructure. The global SiC CMP Pads market was valued at US\$ 47.97 million in 2024 and is expected to reach US\$ 204.18 million by 2031, growing at a CAGR of 17.15% during 2025-2031. The silicon carbide (SiC) chemical mechanical planarization (CMP) pad market is a critical enabler for next-generation power electronics, with distinct competitive dynamics and technological challenges. At present, considering the cost and the influence of the size of silicon wafers on the performance and efficiency of integrated circuits, the increase in the size of wafers is an inevitable trend and a

mainstream trend, in particular, 8-inch and 12-inch. Wafer may develop in the direction of 18 inches in the future. However, the larger the size, the more difficult it is to produce the corresponding CMP pad. When the downstream size becomes an inevitable trend, in order to occupy the market, it is necessary to be able to develop large-size pad, otherwise it will be eliminated by the market. With the expectation of the superior performance improvement of integrated circuits, the polishing performance of CMP pads has to be increased, so its performance in the future must be more stringent. Several of the current market-oriented enterprises in China have not obtained foreign certifications, so there is no export for the time being. Because downstream companies are mainly concentrated in Japan, Taiwan, South Korea, Europe and the United States and other countries, in addition to Europe and South Korea, these countries have a relatively large market position of CMP polishing pads in several other regions. The electronics industry is mainly concentrated in the Asia-Pacific region, but the current political situation is not optimistic, especially in 2020, it may be the most serious year for China's political crisis in the past 30 years. Due to the current trade frictions and China's current international political factors, it may be the best time for domestic CMP pad manufacturers to occupy the market, and the country's policy investment will increase in the coming years. Therefore, Chinese companies will usher in opportunities for localization in the next few years. We predict that in order to occupy the market, Hubei Dinglong may actively lower the price of the product and madly occupy the market. New investment requires large capital, and it is difficult for small-scale enterprises to enter the industry. CMP Pads has higher requirements on technology level and processing technology. At present, the market is occupied by American companies. The market is not only influenced by the price, but also influenced by the product performance. The leading companies own the advantages on better performance, more abundant product's types, better technical and impeccable after-sales service. Consequently, they take the majority of the market share of high-end market. Looking to the future years, prices gap between different brands will go narrowing. Similarly, there will be fluctuation in gross margin. For manufacturers that have already entered, they need to constantly raise the technical threshold to prevent more companies from entering; by reducing costs and reducing prices, they will quickly occupy the market, develop incremental customer markets, and establish market share advantages; create a brand image and lay an advantage for entering the consumer goods market. Only in this way can we have a larger market share of capital in the fierce competition. Despite this interest, the CMP pad market poses several significant barriers to entry. First, the industry is highly specialized and requires deep technical expertise in materials science, surface chemistry, and wafer process integration. Second, stringent performance requirements ? such as planarity, defectivity, and compatibility with specific slurries ? mean that pad suppliers must go through extensive

qualification processes with semiconductor fabs, which can take years. Additionally, the market is dominated by a few entrenched players with long-term relationships and proprietary technologies, making it difficult for newcomers to gain design-ins. High R&D costs, capital investment in precision manufacturing, and the need for global support infrastructure also pose substantial challenges.

The global CMP Pads market size was estimated at USD 1138.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
