Abstracts

Cmp polishing material, also known as chemical mechanical polishing/planarization slurry, is a specialized consumable used in semiconductor manufacturing to achieve ultra-smooth, flat surfaces on silicon wafers during integrated circuit fabrication. It consists of a colloidal suspension of nanoscale abrasive particles (such as silica, ceria, or alumina) dispersed in a chemically active aqueous solution containing oxidizers, surfactants, and pH regulators. The material functions through a synergistic combination of mechanical abrasion and chemical etching, enabling precise removal of surface layers—including silicon, silicon dioxide, metal films, or other materials—while minimizing defects, dishing, and erosion. Its formulation is critical to achieving the nanometer-level planarization required for advanced semiconductor nodes, influencing device performance, yield, and reliability.

The global Cmp Polishing Material market size was estimated at USD 1200.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
