Abstracts

The gantry machining center consists of a high-precision main structure spine bed, column, spindle head, cross slide and worktable. The gantry-type machining center is a precision metal processing machine that can handle multiple machining tasks at the same time. Regarding the milling process of the gantry-type machining center, it is the process of removing workpiece material using a rotating tool by pushing the tool into one or more workpieces. The cutting process can be carried out in different directions, which are based on boxes, just like a lathe is based on boxes. In addition to turning, milling also covers a variety of operations, from single tiny parts to heavy large milling tasks. The gantry-type machining center is designed to process large and thick workpieces. Under normal circumstances, these workpieces will bring huge and unbearable vibrations to the frame and cause uncontrollable deviations from the target accuracy.

The global CNC Gantry Machining Center market size was estimated at USD 1602.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
