Abstracts

The CO Low Temperature Shift Catalyst (LTS catalyst) is a catalyst used in gas shift reactions, primarily to convert carbon monoxide (CO) into carbon dioxide (CO₂), while producing hydrogen (H₂). This reaction typically occurs at lower temperatures (around 200-250°C) and is widely used in hydrogen production, natural gas processing, and fuel cell applications. Low temperature shift catalysts often contain metals such as chromium (Cr), iron (Fe), or copper (Cu), which provide excellent catalytic performance, enabling high CO conversion rates at lower temperatures. Compared to high temperature shift catalysts, LTS catalysts operate under milder conditions and are commonly employed in the latter stages of gas purification and hydrogen production processes.

The global CO Low Temperature Shift Catalyst market size was estimated at USD 1268.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
