### Report Overview

Co-packaged optics (CPO) represent an emerging technology in the data center and high-performance computing sectors, where optical components are integrated directly with switching or computing chips to overcome bandwidth and power limitations of traditional pluggable optics. By reducing the electrical interconnect distance between optical transceivers and processing units, CPO enables higher data transfer speeds, lower latency, and improved energy efficiency, making it a critical innovation for next-gen AI/ML workloads, hyperscale data centers, and 5G networking. The market is driven by escalating demand for higher bandwidth, the need to reduce power consumption in large-scale data centers, and the limitations of copper-based interconnects in supporting next-generation networking speeds. Key players include semiconductor giants, optical component suppliers, and hyperscalers investing in CPO R&D, though challenges such as thermal management, manufacturing complexity, and standardization remain. The market is expected to grow significantly as CPO transitions from early adoption to mainstream deployment in the coming decade.
