Abstracts

A Co2 Energy Storage System is a long-duration energy storage technology that utilizes carbon dioxide as a working fluid in a closed-loop thermodynamic cycle, where electricity is stored by compressing and liquefying CO2 at ambient temperature during charging phases and recovered by expanding the supercritical or liquid CO2 through a turbine during discharge, offering a scalable solution for grid stabilization, renewable energy integration, and peak shaving due to its high energy density, lack of geographical constraints (unlike pumped hydro), and ability to leverage existing industrial components and infrastructure.

The global Co2 Energy Storage System market size was estimated at USD 280.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
