Carbon dioxide (CO₂) generator systems burn either natural gas (NG) or propane (LP) to produce CO₂. Burning these fuels will generate carbon dioxide, heat, and moisture during the combustion process. These generators have a flow meter that regulates the flow of fuel into the system which is then burnt using a pilot light on the burner. Many of the newer designs of burner generators have tip-over shut-off functions (uneven-burning shut off which helps from causing a fire) or produce carbon monoxide that is lethal to humans.

The global CO₂ Generator for Agriculture market size was estimated at USD 276.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
