Report Overview

Carbon dioxide (CO₂) generator systems burn either natural gas (NG) or propane (LP) to produce CO₂. Burning these fuels will generate carbon dioxide, heat, and moisture during the combustion process. These generators have a flow meter that regulates the flow of fuel into the system which is then burnt using a pilot light on the burner. Many of the newer designs of burner generators have tip-over shut-off functions (uneven-burning shut off which helps from causing a fire) or produce carbon monoxide that is lethal to humans.
