## Abstracts

CO<sub>2</sub> mineralization technology is a carbon capture and utilization (CCU) process that converts captured carbon dioxide into stable, solid carbonates by reacting it with naturally occurring or industrially sourced minerals, such as calcium or magnesium silicates. This process mimics natural weathering but accelerates it under controlled conditions. The resulting carbonates are environmentally stable and can be used in construction materials like concrete, thereby permanently sequestering CO<sub>2</sub> while providing valuable byproducts. CO<sub>2</sub> mineralization is a promising approach for reducing greenhouse gas emissions and mitigating climate change, especially when integrated with industrial processes.

The global CO<sub>2</sub> Mineralization market size was estimated at USD 388.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.10% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global CO<sub>2</sub> Mineralization market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
