Abstracts

A CO₂ reforming catalyst, also known as a dry reforming catalyst, is a specialized material—often based on noble metals like nickel, platinum, or rhodium, or more cost-effective alternatives such as cobalt or cerium-based composites—that facilitates the chemical conversion of carbon dioxide (CO₂) and methane (CH₄) into syngas, a mixture of hydrogen (H₂) and carbon monoxide (CO), through an endothermic reaction ($\text{CH}_4 + \text{CO}_2 \rightarrow 2\text{H}_2 + 2\text{CO}$). This process is significant for its dual environmental benefit of consuming two potent greenhouse gases while producing a valuable feedstock for fuels, chemicals, and energy applications. The catalyst must exhibit high activity, stability against coking (carbon deposition), and resistance to sintering under high-temperature conditions, driving ongoing research into optimizing support materials, promoter additives, and nanostructured designs to enhance performance and longevity in industrial settings.

The global Co₂ Reforming Catalyst market size was estimated at USD 125.63 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
