Abstracts

Coal-fired power generation refers to the process of producing electricity through the combustion of pulverized coal in a boiler to generate steam, which then drives a turbine connected to an electrical generator; this method relies on established technologies such as pulverized coal combustion, circulating fluidized bed combustion, and integrated gasification combined cycle systems, with efficiency and emissions control heavily dependent on the plant design, age, and the integration of pollution abatement technologies like flue-gas desulfurization, selective catalytic reduction, and electrostatic precipitators. The global market for coal-fired power generation is experiencing divergent regional trends, characterized by declining capacity and investment in developed economies due to stringent climate policies, carbon pricing mechanisms, and competition from cheaper renewable energy sources, while growth persists in some emerging economies, particularly in Asia, where rapidly increasing electricity demand, domestic coal reserves, and existing infrastructure continue to support new plant development despite growing environmental concerns. Market dynamics are heavily influenced by regulatory frameworks, international climate agreements, technological advancements in carbon capture and storage, fuel price volatility relative to natural gas and renewables, and shifting investor sentiment toward ESG criteria, leading to a complex landscape where coal remains a significant but contested source of baseload power in certain regions while facing long-term structural decline globally.

The global Coal Fired Power Generation market size was estimated at USD 1045.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -2.50% during the forecast period.
