## Abstracts

Coal mine equipment remanufacturing is based on the theory of the entire life cycle of equipment. Through advanced technology and industrialized production methods, the waste, invalid and scrapped coal mine equipment parts are processed by remanufacturing technology to achieve the improvement of product performance and quality of parts and components, with the goal of re-entering normal operation. Remanufactured parts are based on high quality, energy saving, material saving and environmental protection as the criteria, and advanced remanufacturing processing technology and industrialized production as the means to repair and transform waste products and coal machine equipment parts and components. The use environment of coal mine equipment is harsh and the working conditions are harsh. A large number of working surfaces of parts are scrapped due to wear and failure. Remanufacturing can repair the worn surfaces and restore the performance of parts. Through remanufacturing technology, manufacturing companies can reduce manufacturing costs, save energy, materials and protect the environment. The main characteristics of remanufacturing: remanufactured products are not lower than the original new products in terms of product functional attributes, technical performance indicators, energy consumption, environmental protection, economic indicators, etc. The economic, social and ecological benefits of remanufacturing are significant. Generally, remanufactured products can not only reduce costs by 50%, reduce energy consumption by 60%, save materials by 70%, generate almost no solid waste, and reduce air pollutant emissions by about 80%. Remanufacturing engineering is the best form and preferred way to recycle coal mining equipment. It can maximize the value contained in waste resources and help alleviate the contradiction between insufficient resources and energy. National macroeconomic policy support drives the development of the coal mining equipment remanufacturing industry. The prosperity of the coal industry continues to improve. Remanufacturing technology enables the performance and quality of coal mining

equipment to reach the level of new products through the recycling of scrapped equipment and its parts, greatly reducing costs, saving resources and reducing environmental pollution, and has good economic, social and environmental benefits. Therefore, it is imperative to develop the coal mining equipment remanufacturing industry. Remanufacturing has obvious advantages. The remanufacturing method of coal mine equipment is simple and low-cost, which can solve the problems of excessive prices of coal mine equipment, poor sales, and difficulty in collecting payment. China's remanufacturing technology has made significant progress. Remanufacturing is an emerging modern producer service industry with huge development potential. As an important link in extending the industrial chain, the remanufacturing industry can be organically combined with the financial industry and modern service industry to form a "manufacturing-leasing" -Remanufacturing? industrial cycle.

The global Coal Mine Equipment Remanufacturing market size was estimated at USD 6345.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
