Report Overview

Aeration is widely used as a method to remove organic matter in the primary and secondary treatment of wastewater. In particular, immersion bubble aeration can promote the decomposition of organic waste by aerobic bacteria by diffusing small bubbles and mixing them with wastewater, so as to play an effective role. The larger hole of the coarse bubble diffuser means that the diffuser is less likely to scale than the fine bubble diffuser. The bubble volume is larger and more waste liquid is discharged, resulting in more hybrid power. It is not easy to block, and does not need to be cleaned frequently with a high-pressure washer or manual brush, and does not need to be replaced frequently.
