Abstracts

A Coarse Particle Flotation Machine is a specialized flotation device designed to recover coarse mineral particles, addressing the limitations of traditional flotation machines in handling larger particles. Coarse Particle Flotation Machines incorporate innovative designs, such as fluidized bed technology and low-turbulence environments, enabling the effective recovery of mineral particles up to and exceeding 800 microns in size. The core principle of this technology is to reduce the likelihood of particle-bubble detachment and enhance the attachment probability between coarse particles and bubbles, thereby achieving efficient separation. By implementing coarse particle flotation technology, mining operations can achieve effective mineral recovery at coarser grind sizes, which not only reduces energy consumption and grinding costs but also increases the processing capacity of concentrators. Additionally, the tailings produced from coarse particle flotation consist of larger particles, making them easier to dewater and manage, thereby improving tailings handling and water resource management. Overall, the application of Coarse Particle Flotation Machines offers an efficient, energy-saving, and environmentally friendly solution for the mineral processing industry, particularly suitable for processing low-grade ores and complex mineral resources.?

The global Coarse Particle Flotation Machine market size was estimated at USD 317.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
