## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Coated Glass Substrate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A coated glass substrate is a base layer of glass that has been treated with one or more thin film coatings to alter its optical, thermal, or electrical properties for specific applications. These coatings—often composed of metals, metal oxides, or dielectric materials—are applied through processes such as sputtering, chemical vapor deposition (CVD), or pyrolysis to enhance the performance of the glass. Depending on the type of coating, a coated glass substrate can exhibit properties like anti-reflection, UV protection, low emissivity (low-E), conductivity, or enhanced durability. This makes it widely used in industries such as architecture (for energy-efficient windows), electronics (as a component in displays and solar panels), automotive (for defrosting and glare reduction), and optics (in lenses and mirrors). The ability to tailor surface properties while maintaining the structural transparency and strength of the base glass makes coated glass substrates essential in advanced material and device engineering.

The global Coated Glass Substrate market size was estimated at USD 746.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
