Abstracts

A coating for medical implants refers to a specialized surface modification applied to implantable medical devices, such as orthopedic implants, cardiovascular stents, dental implants, or neural implants, designed to enhance biocompatibility, promote osseointegration, prevent infection, reduce inflammation, or deliver therapeutic agents. These coatings can be composed of various materials, including hydroxyapatite, titanium, polymers, bioactive glasses, or antimicrobial agents like silver or antibiotics, and are engineered to interact favorably with biological tissues while mitigating adverse immune responses or rejection. The primary function is to improve the long-term success, functionality, and safety of implants by addressing common post-surgical complications such as bacterial colonization, poor integration with host tissue, or corrosion, thereby extending implant lifespan and patient outcomes.
