Abstracts

The Coating Die Head of Battery is a critical component in the electrode manufacturing process for lithium-ion and other advanced battery types, serving as a precision tool that uniformly applies a slurry of active materials, conductive additives, and binders onto metal foils (such as aluminum for cathodes and copper for anodes) to form the electrodes essential for energy storage and delivery. Its design and performance directly influence coating thickness, uniformity, edge definition, and overall electrode quality, which in turn affect battery capacity, cycle life, and safety. Typically engineered with high-precision slots, internal flow channels, and adjustable lip geometries, the die head must ensure consistent, defect-free deposition at high speeds to meet the demands of mass production, while also accommodating various slurry viscosities and formulations. Materials used in construction—often hardened steels, specialized coatings, or ceramics—must resist wear, corrosion, and abrasion from abrasive particulate slurries, ensuring durability and minimal maintenance downtime in highly controlled manufacturing environments.

The global Coating Die Head Of Battery market size was estimated at USD 315.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
