### Report Overview

The coaxial agitator is connected by the chain to the sprocket at the upper end of the intermediate shaft on one side of the drive shaft, and the passive gear coaxial with the sprocket engages with the driving gear fixed at the lower end of the drive shaft. The two stirring blades of the utility model rotate in reverse so that a convection can be formed between the two stirring blades of the raw material during the stirring process, thus completely solving the problem that the traditional mixer does not mix the raw material.
