Abstracts

Coaxial germanium detectors are high-purity semiconductor radiation detectors designed for precise gamma-ray spectroscopy, utilizing a coaxial geometry that allows for larger active volumes and improved energy resolution compared to planar configurations. These detectors operate at cryogenic temperatures to reduce electronic noise and are characterized by their exceptional efficiency in identifying and quantifying gamma-ray emissions across a broad energy range, making them indispensable in nuclear physics research, non-proliferation monitoring, environmental radiation assessment, and medical isotope analysis. Their performance is defined by key parameters such as energy resolution, peak-to-Compton ratio, and detection efficiency, which are optimized through advanced crystal growth techniques and meticulous electrode design to meet the stringent demands of spectroscopic applications where accurate isotope identification is critical.

The global Coaxial Germanium Detectors market size was estimated at USD 68.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
