Abstracts

Cobalt based self-fluxing alloy powder is developed on the basis of Stellite alloy. Stellite alloy is a famous high-temperature cobalt based alloy, which has good thermal strength, hot corrosion resistance, toughness, and resistance to thermal fatigue and other high-temperature properties. Si Tai Li alloy is mainly composed of cobalt, chromium, and tungsten, so it is also known as cobalt chromium tungsten alloy (CoCrW). Adding boron and silicon elements to CoCrW alloy forms cobalt based self melting alloy. The strengthening mechanism of cobalt based self-fluxing alloy is that a large amount of high hardness carbides and borides are dispersed on the chromium containing cobalt solid solution matrix, which has better oxidation resistance and wear resistance than CoCrW alloy. Its high-temperature hardness is higher than that of nickel based self melting alloy. Cobalt based self-fluxing alloy powder is generally used for surface strengthening and repair of important high-temperature abrasion resistant parts. Such as high-temperature and high-pressure valve plates and seats, exhaust valve sealing surfaces of internal combustion engines, various engine components under hot corrosion conditions, and so on.

The global Cobalt Based Self Fluxing Alloy Powder market size was estimated at USD 196.57 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
