Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cobalt bis(2-ethylhexanoate) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Cobalt bis(2-ethylhexanoate), commonly known as cobalt isooctanoate, is an organic acid metal salt. It is a deep purple-red liquid or viscous substance with good solubility in non-aqueous systems. It is mainly used as a drying agent (drier) in the paint and coating industry and as an accelerator/initiator for the polymerization of unsaturated polyester resins. Its core function is as a redox catalyst, accelerating the curing or drying process. The core upstream raw materials are cobalt salts (such as cobalt chloride, cobalt sulfate, or cobalt hydroxide) and 2-ethylhexanoic acid (isooctanoic acid, derived from the aldol condensation of butyraldehyde). Global sales volume in 2024 was approximately 35,000 tons, with an average market price of approximately US\$5,500 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of production equipment, and the industry's gross profit margin ranges from 15% to 30%. Global demand for coatings and inks continues to grow in the construction, automotive, and infrastructure sectors. As an essential component, the demand for driers is highly correlated with the overall coatings market. The global shift towards high-solids, low-VOC, environmentally friendly formulations in paints and coatings will have some impact on cobalt 2-ethylhexanoate, but its core catalytic role in ensuring curing speed remains difficult to completely replace. Environmental regulations are tightening restrictions on the toxicity of metal elements. Cobalt is considered a potential heavy metal, and regions such as the EU are restricting the use of cobalt-containing driers or promoting alternatives. The research and application of cobalt-free driers (such as bismuth, manganese, and iron driers) pose a direct threat of substitution.

The global Cobalt bis(2-ethylhexanoate) market size was estimated at USD 193.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
