## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on COC Tester competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The CoC Tester is an automated testing system designed for Chip on Carrier (CoC) devices, featuring auto-loading and unloading capabilities with fishbone fixture compatibility, and adaptable for both aging systems and wire bonders. It adopts a dual-platform design to minimize loading/unloading and temperature-control waiting times, and integrates TEC-based temperature control (20?100?C) to achieve precise and stable thermal management. The system supports LIV testing, spectral measurement, and backlight power testing, enabling comprehensive performance validation and screening of CoC chips. Its upstream supply chain includes raw materials such as semiconductor wafers, ceramic or metal substrates, bonding wires, and optical adhesives, along with critical components including TEC cooling modules, precision spectrometers, power meters, photodetectors, and automated handling units, all of which ensure the system's reliability in temperature control, optoelectronic performance, and automation. In 2024, global sales of CoC testers reached 2,481 units, with an average selling price of USD 35,100 per unit and a gross profit margin of 34.9%.

The global COC Tester market size was estimated at USD 87.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
