Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Coccidiosis Vaccines in Chickens competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Coccidiosis vaccines for chickens are immunological preparations designed to protect poultry from coccidiosis, a parasitic disease caused by protozoan parasites belonging to the genus *Eimeria*. These vaccines work by introducing attenuated or live strains of *Eimeria* species into the chicken's system, stimulating an immune response that helps the birds develop immunity against future infections. In China, more than 2.5 billion doses of poultry coccidiosis vaccines are used annually, covering over one-sixth of the total broiler output. The value per dose ranges from RMB 0.05 to 0.08, corresponding to an annual market size of over RMB 150 million. China accounts for approximately 24% of the global market, which exceeds RMB 700 million in total value. The net profit margin for coccidiosis vaccines is around 36%, with a gross margin between 55% and 65%. Over the next five years, the chicken coccidiosis vaccine market is expected to maintain growth, with a compound annual growth rate (CAGR) exceeding 6.1%. This growth momentum is driven by several factors, including rising demand for effective vaccines, technological innovations, supportive policies, and an increasing focus on reducing antibiotic use in the poultry industry. In terms of vaccine types, tetravalent vaccines are gradually replacing trivalent vaccines and becoming the mainstream in the market. Domestic companies such as Foshan Zhengdian, Qilu Qingda, Tianjin Heliante, and Xi'an Skydar play significant roles, with their products widely used in large-scale poultry farms. Globally, Merck (MSD Animal Health) is a leading international brand, known for its broad-spectrum coverage of *Eimeria* species, although its expansion in the Chinese market faces challenges such as pricing, registration, and clinical trial pathways. Tetravalent vaccines, which target more *Eimeria*

species, are expected to further replace traditional trivalent vaccines in the future. In China, coccidiosis vaccines are mainly available in 1,000-dose and 2,000-dose bottles, usually sold in boxes of 10 bottles. The retail price is approximately RMB 80/160 per bottle, translating to RMB 800/1,600 per box. Equivalent products from international leaders such as Merck, Boehringer Ingelheim, and HIPRA are priced 20-40% higher. The tetravalent live vaccine produced by Zhengdian Biotech contains four attenuated Eimeria species: E. tenella, E. necatrix, E. maxima, and E. acervulina. Immunity develops about 14 days post-vaccination and lasts through the end of the rearing cycle. Merck's breeder chicken vaccine contains strong strains of eight Eimeria species: E. maxima, E. acervulina, E. tenella, E. mitis, E. necatrix, E. brunetti, E. praecox, and E. hagani.

The global Coccidiosis Vaccines in Chickens market size was estimated at USD 181.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
