## Abstracts

The coercivity measuring system is a device used to test the ability of materials, particularly magnetic materials, to retain their residual magnetism after the external magnetic field is removed. Coercivity describes a material's resistance to an opposing magnetic field, and it is typically determined by measuring the material's magnetization strength during the gradual decrease of the magnetic field. This measuring system is widely used in industries such as electronics, telecommunications, automotive, and energy, to assess the performance of permanent magnets and ferromagnetic materials, ensuring their stability and reliability in specific applications. The level of coercivity directly influences the material's application scenarios. For instance, materials with high coercivity are suitable for applications that require stable magnetic fields, while low coercivity materials are more suited for applications where magnetization is easily reversible.

The global Coercivity Measuring System market size was estimated at USD 146.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
