Report Overview

PI material is the core difficulty of COF packaging. The COF solution mainly uses PI film mixture materials with a thickness of only 50-100um and a line width and line spacing of less than 20um. It is widely used in the display and driving of LCD screens in LCD TVs, smart 3G mobile phones, laptops and other products. COF packaging is produced using automated roll-to-roll equipment and is continuously heated to 400 degrees Celsius during the production process. Since the COF roll-to-roll production process requires heating, and the thermal expansion coefficient of the PI film is 16um/m/C, compared with the chip's 2.49um/m/C, the thermal stability is poorer, so the equipment accuracy and process requirements are very high.
