## Abstracts

A coherent optical quantum computer is a device that uses coherent light (such as laser) as an information carrier to perform quantum computing. It achieves the storage and operation of quantum bits by manipulating the degrees of freedom of photons such as phase, polarization, and path, and uses linear optical elements (such as beam splitters, phase modulators) and single-photon detection technology to complete quantum logic operations. Compared with quantum computing solutions such as superconducting or ion traps, coherent optical quantum computers have the advantages of low thermal noise, long coherence time, and operation at room temperature, and are considered to be an important direction for realizing large-scale optical quantum computing in the future.

The global Coherent Optical Quantum Computer market size was estimated at USD 310.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.30% during the forecast period.
