Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cold Chamber Die Casting Machinery competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A cold chamber die casting machinery refers to a die casting machine in which the injection chamber and the injection punch are not immersed in the molten metal, but a certain amount of molten metal is poured into the injection chamber and then injection is performed. With the progress of science and technology and industrial production, especially with the development of industries such as automobiles, motorcycles, and household appliances, die-casting technology has achieved extremely rapid development. Die-casting machines are developing in the direction of large-scale, automation, and unitization. Compared with cold chamber die-casting machines, hot chamber die-casting machines have a smaller tonnage and a much lower production volume than cold chamber die-casting machines. 2024 is the year for new car-making forces. With the strong cross-border participation of Internet companies such as Baidu and Xiaomi, the competition in the new energy vehicle industry has become increasingly fierce, and at the same time, it has driven the growth in demand for die-casting equipment. At present, one-piece die-casting parts are mainly used in new energy vehicles to reduce body weight, reduce energy consumption, and increase driving range. The industry believes that by 2030, the market share of new energy vehicles will increase to 50%, and the application prospects of ultra-large die-casting unit integrated molding are very impressive.

The global Cold Chamber Die Casting Machinery market size was estimated at USD 2615.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
