Report Overview

The cold field emission electron gun (CFE) is an electron gun that uses specific materials to directly emit electrons through an electric field under low temperature conditions. It uses the field emission phenomenon generated by strengthening the electric field on the metal surface. Specifically, when a metal surface in a vacuum is subjected to a sufficiently strong electric field, electrons can directly 'tunnel' through a narrow energy barrier and leave the cathode to form an electron beam. The cathode is usually made of a thin tungsten wire, and single-crystalline tungsten is welded on the tungsten wire. The tip curvature radius of the single-crystalline tungsten is about 100nm to provide a sharp emission surface. A metal extraction electrode is set opposite the emitter, and a positive voltage of thousands of volts is applied. Due to the tunneling effect, electrons are emitted from the emitter, and these electrons form an electron beam through the small holes on the extraction electrode. Cold field emission electron guns have been widely used in scanning electron microscopes (SEMs) and other instruments that require high-resolution imaging.
