## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cold Field Emission Source competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Field Emission Source production reached approximately 1,897 units, with an average global market price of around US\$ 82,000 per unit. Cold Field Emission Source is a type of electron emitter that relies solely on a strong electrostatic field to extract electrons via quantum tunneling from a sharp metallic tip, without the need for heating. Typically made from a tungsten needle, it operates in an ultra-high vacuum environment (better than  $10^{-10}$  Pa) to maintain emission stability. Cold field emitters provide extremely high brightness, excellent spatial coherence, and narrow energy spread, making them ideal for ultra-high-resolution applications in Field Emission Scanning Electron Microscopes (FE-SEM) and Transmission Electron Microscopes (FE-TEM). They are widely used in nanotechnology, materials science, and surface analysis.

The global Cold Field Emission Source market size was estimated at USD 156.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
