Abstracts

Cold laser therapy devices, also known as low-level laser therapy (LLLT) or photobiomodulation devices, are non-invasive medical instruments that employ low-intensity lasers or light-emitting diodes (LEDs) to stimulate cellular function, reduce inflammation, and promote tissue repair. These devices emit specific wavelengths of light that penetrate the skin without generating heat, targeting mitochondria to enhance adenosine triphosphate (ATP) production and activate various cellular mechanisms, which in turn accelerates healing, alleviates pain, and improves recovery in both human and veterinary applications. They are commonly used in physical therapy, sports medicine, chiropractic care, dermatology, and pain management, offering a drug-free alternative for treating conditions such as arthritis, tendonitis, wounds, and neuropathic pain. Technological advancements have led to the development of portable, handheld units for home use, as well as more powerful clinical-grade systems, expanding accessibility across diverse user segments.

The global Cold Laser Therapy Device market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
