Abstracts

Cold plasma technology, also referred to as non-thermal plasma, involves the generation of partially ionized gas composed of ions, electrons, reactive atoms, and molecules at near-room temperature, enabling its application to heat-sensitive materials without causing thermal degradation. It functions through the production of highly reactive species?such as ozone, ultraviolet photons, and free radicals?that induce chemical and biological reactions, making it suitable for a diverse range of uses including surface modification, sterilization, wound healing, food preservation, water treatment, and pollution control. This versatility stems from its ability to operate at atmospheric pressure and low temperatures, distinguishing it from traditional thermal plasma methods and expanding its potential across medical, agricultural, industrial, and environmental sectors.

The global Cold Plasma Technology market size was estimated at USD 3650.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 14.80% during the forecast period.
