Abstracts

A Cold Plate Loop is a type of cooling system designed to manage heat dissipation from electronic devices or components by using a cold plate and a closed-loop fluid circulation system. The cold plate is a metal plate, often made of copper or aluminum, that is attached to the heat-generating component (such as a processor, power semiconductor, or laser diode) and transfers the heat to a circulating coolant. The coolant absorbs the heat and then carries it away to a heat exchanger or radiator, where the heat is released into the environment.

The global Cold Plate Loop market size was estimated at USD 265.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
