Abstracts

Cold rolled structural steel refers to a category of steel products formed through a cold reduction process at room temperature, which enhances its strength, surface finish, and dimensional accuracy compared to hot-rolled alternatives. This material is characterized by its precise tolerances, smooth surfaces, and improved mechanical properties, making it suitable for applications requiring high precision, aesthetic appeal, and structural integrity without additional machining or finishing. Commonly produced in shapes such as channels, angles, beams, and custom profiles, cold rolled structural steel is widely used in construction, automotive manufacturing, industrial equipment, storage systems, and consumer goods where durability, consistency, and formability are critical. The cold rolling process involves passing the steel through rollers to reduce thickness while work-hardening the material, resulting in increased yield strength and hardness, though it may reduce ductility unless subsequently annealed.

The global Cold Rolled Structural Steel market size was estimated at USD 152500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
