Report Overview

Cold shrink tubing is a type of tubular insulating material that is used to provide electrical insulation and environmental protection for wires, cables, and connectors. Unlike traditional heat shrink tubing, cold shrink tubing does not require heat to shrink and conform to the underlying substrate. It is pre-stretched and assembled onto a removable plastic core, which holds the tubing in a compressed state. During installation, the plastic core is removed, allowing the tubing to shrink and tightly seal around the target object. The contraction is achieved by the inherent elasticity of the material. Cold shrink tubing is often made of silicone rubber or EPDM (ethylene propylene diene monomer) rubber, which provide excellent electrical insulation, moisture resistance, and UV resistance. It is commonly used in telecommunications, power distribution, and other industries where quick and reliable installation of cable and wire protection is required. Cold shrink tubing offers convenience, flexibility, and durability while ensuring a secure and long-lasting connection.

The global Cold Shrink Tubing market size was estimated at USD 896.60 million in 2023 and is projected to reach USD 1540.70 million by 2032, exhibiting a CAGR of 6.20% during the forecast period.
