Abstracts

Cold water swelling starches (CWS) are modified starches that hydrate and swell rapidly in cold water without the need for heating, offering functional properties such as thickening, gelling, stabilizing, and texturizing in applications where heat is either undesirable or impractical. These starches are typically derived from sources like corn, potato, tapioca, or wheat and undergo physical, chemical, or enzymatic modifications to disrupt their granular structure, enabling instant solubility and viscosity development at ambient temperatures. CWS starches are distinguished by their convenience, energy efficiency, and ability to maintain the integrity of heat-sensitive ingredients, making them particularly valuable in industries such as instant foods, desserts, sauces, dairy alternatives, and pharmaceutical formulations where quick dissolution and controlled rheology are critical. Their performance can be tailored through the type of modification and base starch used, allowing for specific functionalities like high shear tolerance, freeze-thaw stability, or acid resistance, which expands their utility across diverse product formulations.

The global Cold Water Swelling Starches market size was estimated at USD 425.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
