Abstracts

Collagen is a high molecular weight protein that mainly exists in connective tissues such as animal skin, bones, cartilage, etc. It is the main component of the extracellular matrix. Its molecular structure consists of three polypeptide chains, forming a triple helix structure that endows it with unique mechanical strength and stability. Due to its natural biocompatibility, degradability, and controllable release characteristics, collagen is commonly used as a carrier or coating material in drug delivery systems to achieve controlled release and targeted delivery of drugs by binding or encapsulating them. Collagen can be extracted from animals such as cows, pigs, and fish or obtained through biotechnology, and its drug loading capacity and release efficiency can be optimized through chemical modification or nanotechnology. This type of material is widely used in targeted therapy, sustained-release drug systems, tissue repair, and other fields, such as achieving local delivery and long-lasting effects of drugs in tumor therapy, wound healing, or chronic disease management. The application of collagen in drug delivery systems is becoming increasingly widespread, and the market size continues to grow. Technological progress, medical demand, and policy support are the main driving factors. The development of recombinant DNA technology and biosynthetic methods has made collagen production more efficient and controllable, reduced production costs, and improved product quality. The demand for efficient, safe, and controllable drug delivery systems is increasing day by day. Collagen, as a natural biomaterial, has good biocompatibility and degradability, which can meet these needs. The increasing support from governments around the world for the biopharmaceutical industry has provided a favorable policy environment for the application of collagen in drug delivery systems. At present, there are various types of collagen products on the market, and competition is fierce. Internationally renowned companies such as Rousselot, Eligo Bioscience, Suture, etc. dominate the high-end market with strong research and development capabilities and brand influence. Domestic enterprises such

as Shanxi Jinbo Biopharmaceutical and Giant Biogene have also achieved significant results in independent research and development or cooperation with universities and research institutions, gradually occupying a place in the market. In terms of regions, the European and American markets focus on innovative technology patent protection, and the proportion of recombinant collagen products has been increasing year by year. The characteristic of the Chinese market is that policies promote domestic substitution. In emerging markets such as South America, the growth in medical demand has driven the export of drug delivery materials. The current challenges in the industry mainly include high R&D investment and technological barriers, strict regulatory approvals, and the risk of immune rejection of animal derived collagen. The future technological breakthrough direction is to achieve high purity and low immunogenicity of collagen through genetic engineering technology, as well as to develop nanoscale collagen carriers to improve drug loading efficiency and targeting.

The global Collagen Used For Drugs Delivery market size was estimated at USD 900.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
