Abstracts

Collimating capillary lenses are specialized optical components designed to efficiently collimate divergent X-ray beams generated by laboratory-scale sources, such as microfocus tubes, by utilizing a tapered glass capillary structure that guides photons via total external reflection to produce a highly parallel and intense output beam; these lenses are critical in applications requiring precise X-ray manipulation, including X-ray diffraction, fluorescence analysis, and high-resolution imaging, where they enhance flux density and signal-to-noise ratios by minimizing beam divergence without significant intensity loss.

The global Collimating Capillary Lens market size was estimated at USD 80.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
