Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Collimator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A collimator is a device used to control and adjust the propagation direction of rays (such as X-rays, gamma rays, etc.) or particle beams so that they travel along a specific path. It is usually made of high-density materials (such as tungsten alloys) and is designed with channels or holes of specific shapes and sizes to limit the diffusion of rays and reduce side scattering, ensuring that the rays accurately irradiate the target area. Collimators are widely used in medical imaging equipment (such as CT scanners), radiotherapy equipment, and other scientific and industrial fields that require precise control of radiation direction. They are essential for improving image quality and reducing radiation exposure in non-target areas.

The global Collimator market size was estimated at USD 1012.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Collimator market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
