Abstracts

Color changing microcapsules are microscopic spheres containing thermochromic or photochromic dyes that reversibly alter their visible color in response to specific external stimuli?typically temperature fluctuations or UV light exposure. These microcapsules are engineered with protective polymer shells that isolate the active color-shifting components, enhancing their durability, stability, and compatibility when integrated into various host materials such as inks, plastics, textiles, coatings, or cosmetics. The encapsulation process allows the functional dye to maintain its responsiveness while being shielded from environmental degradation, enabling precise and reliable performance in applications ranging from smart packaging and product authentication to mood-responsive apparel and safety indicators.

The global Color Changing Microcapsules market size was estimated at USD 215.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
