Report Overview

A color filter consists of a slim glass substrate and color resist. Three types of color resist, red (R), green (G) and blue (B) are used to form a lattice pattern on the glass. Each spot of color resist is called a subpixel. The subpixels are divided from its adjacent subpixel by a black matrix (BM) in order to prevent the colors from being mixed. The black matrix also plays the role of preventing light leakage when the color black is displayed on the screen.
