### Report Overview

Color filters for liquid crystals are a key component commonly used in liquid crystal displays to produce color images. They help LCD screens display different colors by controlling the transmission and blocking of light. The basic structure of the color filter is composed of a glass substrate, a black matrix, a color layer, a protective layer, and an ITO conductive film. LCD flat panel displays are non-active light-emitting components. The color display must be provided by an internal backlight module or external ambient light. It is then matched with a driver IC and liquid crystal control to form a grayscale display, and then through a color filter. The R, G, and B color layers provide hue to form a color display.
