Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Comber Noil competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global comber noil production reached 186,000 tons, with an average selling price of \$1,620 per ton. Comber noil is waste generated when combers refine fiber tufts using a double-end combing mechanism. Combing, a core step in the cotton spinning process, uses the synergistic action of a cylinder and a top comb to selectively remove short fibers and impurities, while also improving fiber straightness and uniformity. During this process, short fibers that are not effectively held, along with neps and impurities, are separated, forming comber noil. The Comber Noil market is currently experiencing a positive trend, with major sales regions including Asia-Pacific, North America, and Europe. The market is characterized by a high level of concentration, with a few key players dominating the industry. However, this also presents opportunities for smaller companies to enter the market and carve out a niche for themselves. One of the major challenges facing the Comber Noil market is the fluctuating prices of raw materials, which can impact profit margins for manufacturers. Additionally, increasing competition and changing consumer preferences pose challenges for companies looking to maintain their market share. Overall, the Comber Noil market is poised for growth, but companies will need to adapt to changing market conditions in order to succeed.

The global Comber Noil market size was estimated at USD 301.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
