Abstracts

Combined Cycle Gas Turbine (CCGT) technology refers to a highly efficient power generation system that integrates gas and steam turbines to maximize electricity output from the same fuel source. In this setup, natural gas is burned in a gas turbine to produce electricity, while the waste heat from the exhaust gases is recovered to generate steam, which then drives a steam turbine to produce additional power. This dual-cycle approach significantly enhances overall thermal efficiency, typically achieving rates of 50-60% or higher, compared to around 30-40% for conventional single-cycle gas or coal plants. CCGT plants are valued for their operational flexibility, relatively low carbon emissions compared to coal-fired alternatives, and ability to support grid stability by providing both base-load and peaking power. They play a critical role in the global transition toward cleaner energy systems, often serving as a bridge between traditional fossil fuels and increasing renewable energy integration due to their rapid startup times and ability to balance intermittent sources like wind and solar.

The global Combined Cycle Gas Turbine market size was estimated at USD 25250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
