Report Overview

Combined heat and power (CHP) is a highly efficient process that captures and utilizes the heat that is a by-product of the electricity generation process. By generating heat and power simultaneously, CHP can reduce carbon emissions by up to 30% compared to the separate means of conventional generation via a boiler and power station.

The heat generated during this process is supplied to an appropriately matched heat demand that would otherwise be met by a conventional boiler. CHP systems are highly efficient, making use of the heat which would otherwise be wasted when generating electrical or mechanical power. This allows heat requirements to be met that would otherwise require additional fuel to be burnt.

For many organizations, CHP is the measure that offers the most significant single opportunity to reduce energy costs and to improve environmental performance with existing users of CHP typically saving around 20% of their energy costs.

Combined heat and power (CHP) systems for homes or small commercial buildings are often fueled by natural gas to produce electricity and heat. This report studies the Commercial Combined Heat and Power (CHP) System market, mainly used in the residential, service sector and others.
