Abstracts

A combustion analysis system is a sophisticated suite of instruments used to measure and analyze the products of combustion in real-time, primarily to assess the efficiency, safety, and environmental compliance of fuel-burning equipment such as boilers, furnaces, engines, and industrial processes. These systems typically measure critical parameters including oxygen (O₂), carbon monoxide (CO), carbon dioxide (CO₂), nitrogen oxides (NO_x), sulfur dioxide (SO₂), flue gas temperature, and draft pressure, providing data essential for optimizing fuel-to-air ratios, minimizing emissions, ensuring complete combustion, and preventing hazardous conditions like backdraft or carbon monoxide buildup. Advanced systems often integrate sensors, data loggers, and software for trend analysis and reporting, catering to applications in HVAC, manufacturing, power generation, and environmental monitoring where precise combustion control is vital for operational performance and regulatory adherence.

The global Combustion Analysis System market size was estimated at USD 370.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
