Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Combustion Ion Chromatography (CIC) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Combustion Ion Chromatography (CIC) is an advanced analytical instrument that combines combustion and ion chromatography to detect and quantify halogens (such as fluorine, chlorine, bromine, and iodine) and sulfur in solid, liquid, or gaseous samples. The system first combusts the sample in an oxygen-rich environment at high temperatures, converting bound halogens and sulfur into ionic forms (e.g., HF, HCl, SO₂). These combustion gases are then absorbed in a solution and analyzed using ion chromatography, which separates and quantifies the individual ions. CIC is widely used in environmental testing, materials screening, electronics manufacturing (for detecting halogen-free components), and compliance with regulations like RoHS and WEEE.

The global Combustion Ion Chromatography (CIC) market size was estimated at USD 85.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
