Report Overview

In an induction cooktop ('induction hob' or 'induction stove'), a coil of copper wire is placed under the cooking pot and an alternating electric current is passed through it. The resulting oscillating magnetic field induces a magnetic flux which repeatedly magnetises the pot, treating it like the lossy magnetic core of a transformer. This produces large eddy currents in the pot, which because of the resistance of the pot, heats it.

Induction offers the following benefits and performance advantages:

Faster. Because energy is directly transferred within the pan metal, cooking on an electric induction range is extremely fast - even faster than gas. In the foodservice industry time is money, and a faster cooking surface results in shorter preparation time. And we all know what that means ... increased profits!
