Report Overview

A turboshift engine is a type of turbine engine that uses the airflow produced by the combustion chamber to drive the output shaft power of the free turbine instead of jet thrust. The structure is similar to a turboprop engine, but the main difference is that the exhaust gas from the turboprop also produces some residual propulsion. In addition, for turboprop engines, the final drive of the transmission system is integrated on the engine, while for turboshift engines, it is separated.
