Abstracts

Common mode choke filters consist of two or more coils of insulated wire on a single magnetic core. Each winding is put in series with one of the conductors. This means that the magnetic fields of the wires combine to present high impedance to the noise signal. In order to improve the stability of the system in terms of electromagnetic compatibility, common mode choke coils are usually included in automotive CAN networks (EMC). By using May transceivers, electromagnetic interference generated by electronic control units (ECUs) can be filtered out, reducing the amount of unwanted high-frequency noise on the communication bus. Another reason to use common mode chokes is to increase the transceiver's sensitivity (immunity) to bus EMI. Expansion of common mode choke coils is expected to drive the market. The telecommunications sector is now one of the fastest expanding industries. Over the past decade, the amount of global telecom investment and market expansion has increased substantially. This is due to the increasing use of mobile technology and the rapidly expanding use of high-speed data services. With the advent of big data, the telecom industry is going through a huge transformation. The market is expected to flourish amidst the expansion of the market due to the widespread use of common mode choke coils in the telecom industry and the rapidly expanding nature of the telecom industry.

The global Common Mode Choke Filters market size was estimated at USD 660.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
