Report Overview:

The diesel common rail injection system refers to a fuel supply method that completely separates the generation of injection pressure and the injection process from each other in a closed-loop system composed of a high-pressure oil pump, a pressure sensor and an electronic control unit (ECU). The Diesel Injection System is completely different. It uses a high-pressure oil pump to deliver high-pressure fuel to the oil rail, and realizes precise control through the oil pressure in the oil rail, so that the pressure of the high-pressure oil pipe has nothing to do with the engine speed, which can greatly reduce the degree of variation of the fuel supply pressure of the diesel engine with the engine speed .

The Global Common Rail Diesel Injection System Market Size was estimated at USD 8296.42 million in 2023 and is projected to reach USD 7906.07 million by 2029, exhibiting a CAGR of -0.80% during the forecast period.
